

The Mars Planet

Let's travel, come learn how to float
And find all the secrets that planets hold.
We shall begin with the Sun and its flame scars
And continue with comets and shooting stars.
Let's surround the entire Universe - as big as it is
And let go to our deepest and greatest fears.
Let's just take a look at the Solar System again
And forget any other thing that's generally foreign.
Our peculiar trip starts on...the orbit let's say
And we end up in a place where we can't stay.
We end up on an earthly and rocky planet
That's name is Mars as we all know it.
But because it has plenty of iron oxide overall
Sometimes it's the planet with red soul.
So the Red planet has two satellites around
Phobos and Deimos, as they are called.
On it we find the highest mountain known
Olympus Mons it is and it's all made of stone.
Finally Mars is the 4th when it comes to order
But it's friends with Earth even if it's further.
